

Introduction To Neuro-Developmental Treatment

June 13, 14, 15, 2018 | 214 Concession Street,
Kingston, On

Training Information

This 3-day course utilizes a hands-on problem solving model. Typical motor development is presented within a systems perspective with the focus of study highlighting how musculoskeletal alignment contributes to the development of upper extremity function, oral motor function, phonation, and functional mobility. The systems framework also assists when over-viewing atypical development of children with motor challenges and how these challenges impact alignment, self-regulation, and motor control.

Participants will:

- learn to utilize problem solving and movement analysis within the assessment and treatment process
- develop a basic level of skill in problem solving during facilitation of movement
- have the opportunity to learn through lectures, handling skills labs, treatment demonstrations and in small groups.

Spaces are limited to 20 participants.

Instructor: Shelley Mannell, Physical Therapist

Shelley Mannell is a Physical Therapist with 30 years experience serving children across the spectrum of neurological and developmental disabilities. Shelley founded HeartSpace PT in order provide progressive, individualized treatment to support clients across their lifespan. Shelley blends research and innovative clinical applications of sensory and motor approaches in the treatment of postural control and functional skills. She is a certified NDT therapist, a certified children's mediation facilitator and the co-creator of Dynamic Core for Kids, an evidence-based approach to central stability. Shelley began teaching as clinical faculty at McMaster University and now teaches internationally regarding the dynamic systems nature of posture control and its application to intervention for children with sensory and motor challenges. www.hearspacept.com
